{
  "tokenomics": "NEAR Protocol operates on a native utility token called NEAR. The total supply is around 1,225,066,553 NEAR, out of which, approximately 1,217,906,154 are in circulation. The token is used for network fees for processing transactions and storing data, also used in staking and governance mechanisms. Staking rewards are offered to validators. There's no specific information available about token burning.",
  "blockchain": {
    "choice": "NEAR protocol uses its own proof-of-stake blockchain, designed to speed up the development and adoption of decentralized applications (dapps).",
    "features": "Features include sharding for scalability, low fee structures, and simplicity for developers building on the platform. It also focuses on usability with easy onboarding process for new users.",
    "benefits": "NEAR protocol is designed to provide speed and scalability, which make it ideal for developers to build dapps. The lower transaction fees and stake rewards offer incentives for validators and users."
  },
  "comparison": "When compared with similar blockchain projects, NEAR Protocol offers a more user-friendly and developer-friendly approach, mainly due to its scalability and fast transactions. Despite its younger age, it has quickly risen to a top-ranked position which indicates its potential. It competes with other programmable blockchains like Ethereum and Polkadot, but distinguishes itself through its strong emphasis on usability and simplicity for developers and end-users."
